User's Manual

About Simco-Ion

Simco-Ion develops, manufactures, and markets system solutions to manage electrostatic charge. As the world's largest provider of electrostatics management products and services, Simco-Ion improves its customers' business results by providing a total solution to their electrostatic discharge and electromagnetic interference challenges. Simco-Ion is a division of Illinois Tool Works (ITW) with its Technology Group located in Alameda, California. For more information about Simco-Ion visit www.simco-ion.com or call 800-367-2452. Simco-Ion is ISO 9001 and ANSI ESD S20.20 certified.

Important Safety Information

Failure to follow these important safety cautions could result in damage to Digital AeroBar System components and voiding of your system warranty.

- Use proper input voltage to avoid damaging the unit.
- Verify that the AeroBar is not powered before connecting or removing cables. Failure to do so may result in damage to the equipment.
- Never power-down an AeroBar by removing the cables, as this can result in damage to the ionizer.
- Do not clean emitter points while unit is powered. Doing so may result in additional contamination and possible shock.
- To avoid personal injury or damage to the equipment, perform only the installation and maintenance procedures contained in this manual.

Description

1.1 Overview

1.2 Remote Control

1.3 Power Requirements

1.1 Overview

The Digital AeroBar Model 5225S is specifically designed for use in a variety of applications, ranging from inside tools to work stations and cleanroom areas where digital performance with easy integration is desired.

The Model 5225S operates as a standalone system with internally maintained settings. Setup and adjustment are performed with the infrared Handheld Remote.

The AeroBar Model 5225S is available in five standard lengths:

- 22 inches (558 mm)
- 28 inches (711 mm)
- 44 inches (1118 mm)
- 64 inches (1626 mm)
- 84 inches (2134 mm)

Three lengths are also available with optimized placement of emitter points over the FOUP openings for use in 300 mm EFEMs.

- 36 inches (907 mm)
- 56 inches (1412 mm)
- 76 inches (1918 mm)

AeroBar Controls and Connectors

Figure 1. AeroBar Model 5225S
(Bar is longer than shown. The number of emitter points will vary per bar.)

1. **Modular Port:** A modular port on one end of the bar allows a RJ-11 connection to the 24 VAC power supply for the bar.
2. **Emitter Points:** Emitters points are replaceable. The number of points depend on the length of the bar.
3. **Positive and Negative Ion Output Indicators:** LEDs indicate high voltage (HV) ionization. In Pulsed DC mode, lights flash depending on which polarity has HV. Lights are continuously on when in Steady State mode. Both positive and negative ion indicators and the Alarm LED flash once simultaneously during communication.
4. **Transmit and Receive LEDs:** LEDs communicate with an optional IR remote control.
5. **Alarm LED:** LED flashes when the AeroBar is in alarm or standby mode; also flashes once during communication with the IR remote.

Emitter Points

Emitter points are replaceable. The number of points depends on the length of the bar.

| Length of Bar in Inches | No. of Emitter Points |
|--------------------------------|-----------------------|
| 22 | 5 |
| 28 | 7 |
| 36 (2-load port configuration) | 8 |
| 44 | 9 |
| 56 (3-load port configuration) | 12 |
| 64 | 13 |
| 76 (4-load port configuration) | 16 |
| 84 | 17 |

Indicators

Positive and Negative Ion Output Indicators

These LEDs indicate high voltage (HV) ionization. In pulsed DC mode, the lights flash depending on which polarity has high voltage. Lights are continuously on when in steady state DC mode. Both of the positive and negative ion indicators and the alarm LED flash once simultaneously during communication.

Transmit and Receive LEDs

These LEDs indicate communication with the Remote Control.

Alarm LED

The red alarm LED flashes when the AeroBar is in alarm or standby mode; also flashes once during communication with the Remote Control.

1.2 Remote Control

The Infrared Remote Control Model 5570 is used to communicate and set the power and timing parameters. Unlike a typical consumer remote control, the 5570 features a narrow infrared beam that prevents communication errors with nearby AeroBars. For best results, hold the remote control within 18-24 inches of an AeroBar's vertical centerline and aim directly at the receive LED of the AeroBar. When the AeroBar receives transmission from the remote control, it will flash all three LEDs for one second. Each successive transmission is indicated with a one-second flash after the last received transmission.

There are four buttons on the Remote Control 5570 (Up, Down, Select, and Esc).

- The Up and Down buttons are used to scroll through menu items.
- The Select button selects an item to be changed.
- The Esc button wakes the remote control from sleep mode, or exits from the activity of a parameter being changed.

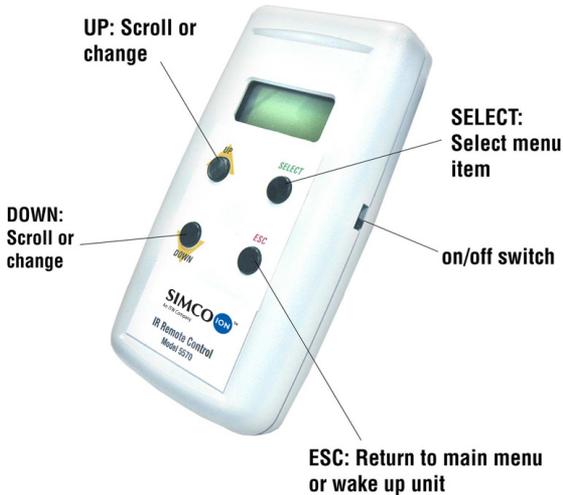

Figure 2. Remote Control Buttons

Passwords

The Remote Control features two levels of access: a User Menu level, and a Technical Field Service (TFS) menu.

- The User Menu level allows you to view current AeroBar settings, change the operation mode, change the positive and negative output levels, and set the on times and off times.
- The TFS Menu is password-protected and all basic and advanced parameters can be changed.

Both the User Menu and TFS Menu feature two lines of information. The first line displays the item of the menu. The second line displays the current adjustment level or operation mode for that item.

An on/off slide switch is featured on the right side of the remote control. Upon powerup, the 5570 remote control shows the following:

UsrMenu
Ver 2.6

Most menu items of the Remote Control require a password in order to be changed. The positive and negative output levels of an AeroBar can be changed without a password. The password is: **Esc, Down, Up, Select, Select, Select, Select.**

Sleep Mode

The Remote Control Model 5570 automatically goes into sleep mode if there is no button activity for 15 seconds. Press the Esc key to awaken the remote control. While in sleep mode, the LCD displays:

Use ESC
To Awake

If the battery is low during sleep mode, the bottom line is replaced with **LowBatt.**

1.3 Power Requirements

The AeroBar can be powered from any 24 VAC source using one of the following options:

- Hard wire to a DIN rail mount transformer (p/n 14-21730)
- Connect to DIN rail mount transformer through a junction box using an RJ-11 to RJ-11 interconnect cable (p/n 33-1700-xx)
- Connect to a 100/115/230 VAC switchable desktop transformer (p/n 14-1535).

2

Installation

- 2.1 Mounting
- 2.2 Wiring
- 2.3 FMS Connection
- 2.4 Daisy-chaining

Important Safety Information

Failure to follow these important safety cautions could result in damage to Digital AeroBar System components and voiding of your system warranty.

Before installing or operating any components, carefully read the following safety information:

- After removing power from the AeroBar(s), allow a minute for the high voltage power supplies to discharge.
- Use proper input voltage to avoid damaging the unit.

2.1 Mounting

General Guidelines

Installation methods will vary, as all process equipment has different requirements. Use the following general guidelines:

- Install AeroBars away from all moving components in the tool or environment.
- Place AeroBars directly in the airflow from HEPA filters for effective ionization discharge.
- Make sure that there are no obstructions in the airflow between the AeroBar and the surfaces to be neutralized.
- Ensure there is unobstructed airflow over emitter points.
- Keep emitter points at least 4 inches (100 mm) from grounded surfaces, including tool frames, skins, and other modules.
- Keep the AeroBars within a 12-36" (300-900 mm) working distance from the wafers.

Keep in mind the following considerations when determining locations for the units:

- Tool and mini-environment requirements/restrictions
- Line of sight to infrared LED on the bar
- Applicable SEMI standards
- Applicable National Electrical Code standards
- The least amount of distance for cables from the Interface Module to AeroBars

Clips

Various mounting clips are available from Simco-Ion.

In general:

- Hold the bar to the grid or other structure and mark the locations where the mounting clips will attach.
- Attach the clips to the AeroBar and mount them at the marked locations. Check to make sure all clips are secure, and that the AeroBar is held firmly in position.

Flat metal clip (p/n 28-6255): Two required for 44" bars; three for 64", 76", and 84" bars.

A polycarbonate rod and clip assembly is also available #93-1420 (4"), 93-1421 (8"), 93-1422 (12")

Mid-clip for hang mount (p/n 28-6240): Use alone or in conjunction with end clips for bars over 44" in length.

May be used with end clip 28-6235

Grid clip for perforated panels (p/n 28-6257): Use for bars 44" or shorter.

Requires two pine tree fasteners #28-0505.

Eggcrate mid-clips (p/n 28-6230): Use alone or in conjunction with end clips for bars over 44" in length.

Requires eggcrate endclip #28-6225 with two pine tree fasteners #28-0505.

Mounting Clip Recommendations

| Bar Length | Number of Clips |
|-------------------------------|-----------------|
| 22-44 inches (11.8–71.1 cm) | 2 |
| 56-84 inches (162.6–213.4 cm) | 3 |

2.2 Wiring

The AeroBar may be hard wired directly to 24 VAC line voltage, or to a 24 VAC transformer. Two 24 VAC transformer options are available from Simco-Ion:

- 230/240 VAC DIN Rail Mount transformer (p/n 14-21730)
- 100/115/230 VAC switchable desktop transformer (p/n 14-1535)

Connection to Power

The AeroBar can be directly wired to a 24 VAC source using wire terminations.

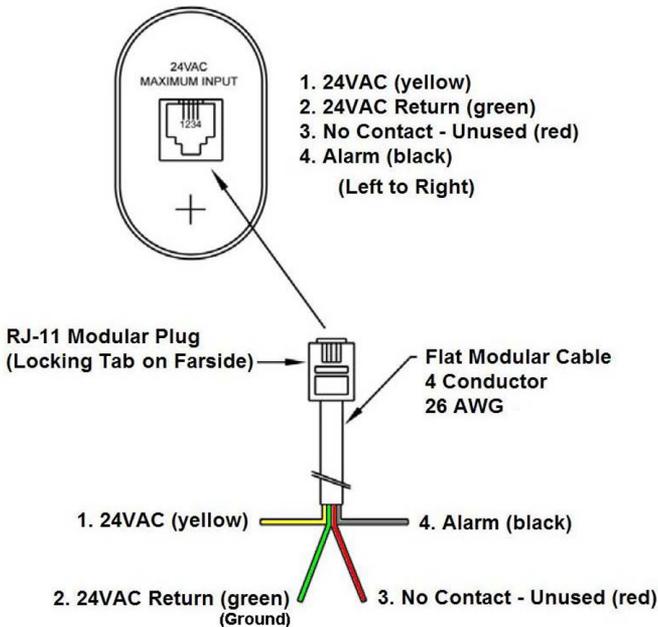

Figure 3. Interconnect Cable Information

Connection to the DIN Rail Mount Transformer

The interconnect cable can be connected to the DIN Rail mount transformer (Simco-Ion p/n 14-21730) using either a bare wire

termination or an interconnect cable with an RJ-11 connector to a Junction Box (p/n 33-1825) wired to the transformer. (An RJ-11 connector is used at the AeroBar.)

Direct Wire

To wire directly to the transformer, use the wiring diagram shown in the figure below. Connect the 24 VAC and 24 VAC return wires and cut the unused #3 wire. The Alarm line will be wired to an FMS connection, if used.

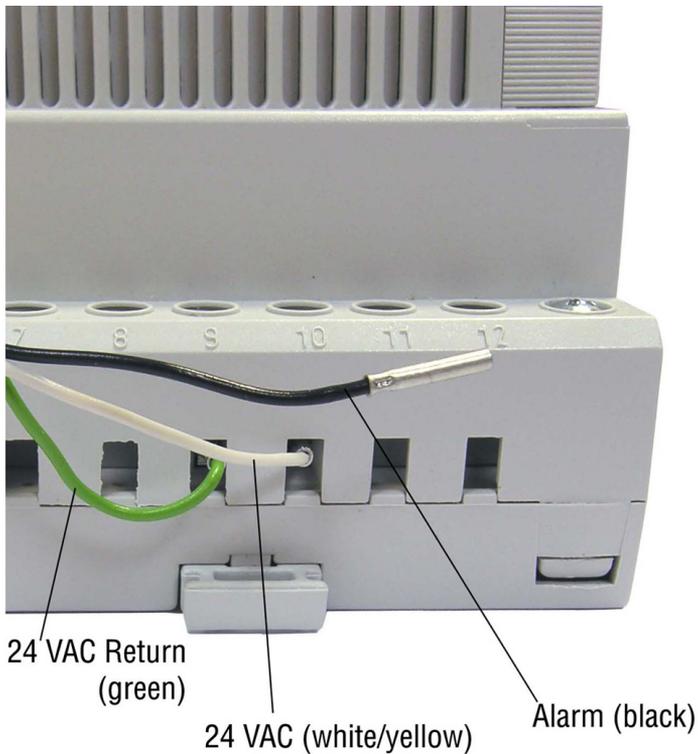

Figure 4. Wiring Interconnect Cable or J-box Directly to the Transformer

J-box Wiring

To use the RJ-11 connector, wire the junction box to the transformer according to **Figure 4** and physically attach it to the side of the transformer or in close proximity to the transformer. See **Figure 7** for suggested mounting.

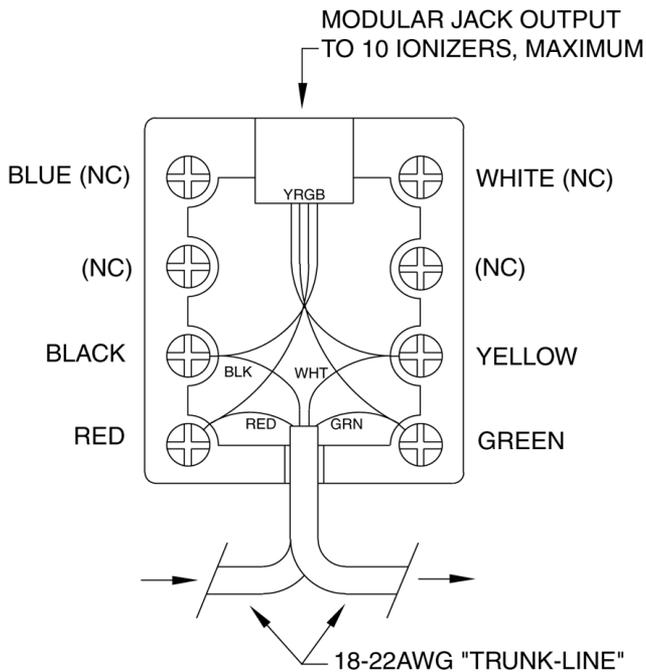

Figure 5. J-box Wiring

Contact Simco-Ion for specific information on wiring the j-box (techsupport@ion.com or 510.217.0470).

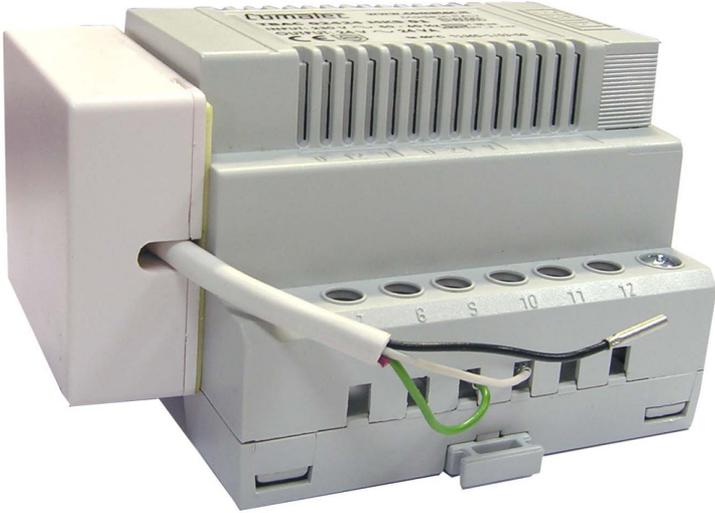

Figure 6. J-box Mounting Suggestion

When using the FMS output connection with the DIN rail mount transformer, the FMS signal must be wired to the your FMS system either by direct wire or through a junction box alarm wire.

Connection to the Desktop Transformer

Wiring to the 100/115/230 VAC switchable desktop transformer (Simco-Ion p/n 14-1535) requires an interconnect cable with an RJ-11 4-wire connector at the AeroBar end and an RJ-22 4-wire connector at the transformer end. Pre-made interconnect cables with these connectors are available from Simco-Ion (p/n 33-1725-10).

2.4 Daisy-chaining

Where AeroBars are used together in the same tool or in close proximity, it may be desirable to daisy-chain the AeroBars to the same power source. **Up to 10 AeroBars can be daisy-chained together using** standard interconnect cables in between the AeroBars. Plug the connectors into the ends of each AeroBar and connect the last cable to the power source.

If it is more convenient to wire the AeroBars in a drop-tee configuration, junction boxes may installed at the tee sites and wired together using 18-22 AWG cable. The RJ-11 connectors from the AeroBar cables can then be plugged into the junction boxes.

Note: In either the daisy-chain or the “Drop-T” configuration the alarm outputs of all the ionizers will be logically “OR” together.

A bracket or hanging device may need to be constructed, depending on your application. Wire management clips are available to secure an AeroBar the cables to the topside of the AeroBars where necessary to a custom bracket.

3

Operation

- 3.1 About AeroBar Adjustments
- 3.2 Using the Remote Control
- 3.3 Ionization Mode (OpMode)
- 3.4 Output Voltages
- 3.5 On- and Off-times (Pulsed DC Mode Only)
- 3.6 FMS Alarm Values
- 3.7 Balance Adjustment and System Calibration

3.1 About AeroBar Adjustments

The following adjustments are available to operate and fine-tune ionization performance in a new installation:

- Set the AeroBar ionization mode for each zone of operation
- Set positive and negative output voltages
- Set positive and negative ontimes and offtimes (pulsed DC mode only)
- Set FMS alarm values
- Place Ionizers in Standby Mode

Operating Environment

Do not operate any component of the AeroBar Ionization System in corrosive or explosive environments. Operate the units in 60-95°F (16-35°C) temperature, 40-65% relative humidity, non-condensing.

3.2 Using the Remote Control

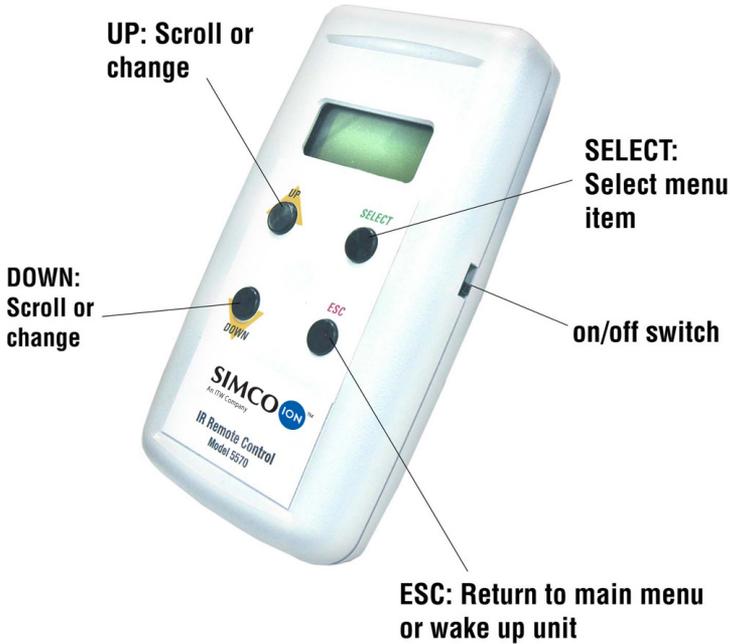

Figure 8. Handheld Remote Control

Power

An on/off slide switch is featured on the right side of the remote control. Upon powerup, the remote control shows the following:

**UsrMenu
Ver 2.6**

Passwords

Most menu items of the Remote Control require a password in order to be changed. The positive and negative output levels of an AeroBar can be changed without a password. The password is: **Esc, Down, Up, Select, Select, Select, Select.**

Battery Life and Replacement

The Remote Control uses two AA alkaline batteries. Life is approximately 60 hours for full operation, and approximately 500 hours while in sleep mode. If the battery voltage drops to ~2V, low battery will be indicated on the second line of the LCD display. Turn the remote control off with the slide switch to conserve battery life.

Sleep Mode

The Remote Control Model 5570 automatically goes into sleep mode if there is no button activity for 15 seconds. Press the Esc key to awaken the remote control. While in sleep mode, the LCD displays:

**Use ESC
To Awake**

If the battery is low during sleep mode, the bottom line is replaced with **LowBatt**.

Garbled Responses

If you see “ReTry” or “&\$%#” on the bottom line of the Remote Control, the Remote Control may be too close to the AeroBar or is not lined up correctly. Move farther away from the AeroBar and target the infrared source at the center red LED.

Remote Control Menu

The following table lists the parameters in both menus of the Remote Control. The TFMenu is a password protected menu. Use the UP or DOWN buttons to scroll through these parameters.

| | TFSMenu | User Menu |
|---------------------------|---|------------------|
| Password | Hold down any button while turning the remote control on and then: Esc, Down, Up, Select, Select, Select, Select. | None |
| | Status | Status |
| | PosFdbk | PosOut |
| | NegFdbk | NegOut |
| | Address* | |
| | OpMode | |
| | PosOn | |
| | PosOff | |
| | PosOut | |
| | Pos Alarm | |
| | NegOn | |
| | NegOff | |
| | NegOut | |
| | NegAlarm | |
| Viewable paramters | Eprom | |

* This item is not applicable with the Model 5225S AeroBar but appears in the list of parameters in the Remote Control.

Descriptions of each parameter are below:

| | |
|------------------------|---|
| Status | <p>Indicates the reported status of an AeroBar as follows: Ok: if the AeroBar is operating normally. Standby: if the AeroBar is in standby. PosAlrm: if the positive emitter is in alarm. NegAlrm: if the negative emitter is in alarm. Pos&Neg: if both positive and negative emitters are in alarm. Retry: if the AeroBar did not reply to a communication query. #%&@\$#: if the reply from the AeroBar is not valid.</p> |
| PosFdbk/NegFdbk | <p>The current feedback of the positive or negative emitter, given in percent. Range is 0 to 100%.</p> |
| Address | <p>Not applicable with the Model 5225S AeroBar. The Remote Control is used with several models of Simco-Ion Digital AeroBars.</p> |
| OpMode | <p>Indicates the operating mode of the AeroBar, as follows: <i>Standby</i>: if the AeroBar is in standby. (AeroBar is powered but ionization is turned off.) <i>StdySDC</i>: if the AeroBar is continuously generating both positive and negative ionization. <i>Pulse</i>: if the AeroBar is alternately generating the positive or negative ionization with an optional off period between polarities.</p> |
| PosOn/PosOff | <p>Indicates the internal timing for the “on” time of the positive emitter with a range of 0.5 to 9.9 seconds, or internal timing for the “off” time of the positive emitter with a range of 0.0 to 9.9 seconds.</p> |
| NegOn/NegOff | <p>Indicates the on time of the negative emitter, with a range of 0.5 to 9.9 seconds, or the off time of the negative emitter with a range of 0.0 to 9.9 seconds.</p> |
| PosOut/NegOut | <p>Indicates the output of the positive and negative emitters, with ranges of 0 to 100%.</p> |
| PosAlrm/NegAlrm | <p>Indicates the alarm setpoint with a range of 0 to 100%. For the AeroBar Model 5225, this refers to the FMS alarm.</p> |
| Eprom | <p>Identifies the software release version of the AeroBar.</p> |

3.3 Ionization Mode (OpMode)

About Ionization Modes

The AeroBar allows two different methods of ionization. Both are appropriate for different situations.

Pulsed DC mode is recommended for process tool environments where the distance from the fan filter unit to the target exceeds 24 inches or where fast discharge is necessary. Pulsed DC provides fast decay times and is a good choice unless large metal objects (such as a pre-aligner or measurement tool) are within 12 inches (30 cm) of the AeroBar.

Steady-state DC mode is recommended when the distance between the wafer and AeroBar is 8-2 inches (20-30 cm), or when large metal objects are within 12 inches (30 cm) of the AeroBar.

Steady-state mode may be necessary for most semiconductor tool applications with tight performance specifications, or when low swing voltages are required for sensitive devices (i.e., <100V swings).

| Use Pulsed DC Mode | Use Steady-state DC Mode |
|--|--|
| Distances greater than 24 inches (61 cm) between AeroBar and wafer | Distances 8-2 inches (20-30 cm) between AeroBar and wafer, and for sensitive devices (less than 100V swings) |
| No large metal objects are within 12 inches (30 cm) of AeroBar | Large metal objects are within 12 inches (30 cm) of the AeroBar |

About Standby Mode

Standby mode is a convenient way to turn off high voltage to the ionizer without removing wires or accessing the Interface Module. Standby mode is useful for maintenance periods where settings must be remembered.

1. Hold down any button while turning on the remote control. A password prompt will appear.

2. Enter in the following password: **Esc, Down, Up, Select, Select, Select, Select.**
3. Use the Up or Down button to reach the OpMode item. Press Select.
4. Point the remote control directly at the LEDs on the AeroBar and use the Up or Down button to select the operation mode (Standby, Pulsed, or StdySDC). Press Esc to exit.

3.4 Output Voltages

About Output Voltages

The recommended typical output range is 50-80%.

For bars operating in Pulsed DC mode, adjust the positive and negative output voltages so that the maximum swing values are within 20V of each other, averaging a value as close to zero as possible. The swings should not exceed 150V in either direction.

For bars operating in Steady-state DC mode, adjust the positive and negative output voltages so that the combined value of the positive and negative settings are as close to zero as possible, and $\leq \pm 20V$.

| For Pulsed DC Mode | For Steady-state DC Mode |
|--|--|
| Maximum swing values are within 20V of each other, averaging a value as close to zero as possible. | The combined value of the positive and negative settings are as close to zero as possible, and less than $\pm 20V$. |

Note: If you modify a positive or negative output setting, then that AeroBar will automatically modify its positive or negative alarm to be approximately 1/4 (25%) of the new output setting. These additional changes are not marked as pending, since you did not make them yourself.

Setting Output Voltages

It is important to set output voltages in coordination with environmental readings you get during a balance adjustment. See the Balance Adjustment section in this chapter.

1. Use the Up or Down button to reach the PosOut or NegOut item. Press Select.
2. Use the Up or Down button to adjust the output level accordingly.
3. Press Esc to exit from the change action. The output level has been set.

3.5 On- and Off-times (Pulsed DC Mode Only)

About On- and Off-times

If the decay time is too slow and the voltage swings are less than 100V, increase both the positive and negative ontimes in 0.1 second increments, checking the positive and negative decay times between each adjustment. When changes no longer positively improve performance, set the ontime and offtime at the last beneficial setting.

Adjusting On- and Off-times.

It is important to set positive and negative on or offtimes in coordination with environmental readings you get during a balance adjustment. See the Balance Adjustment section in this chapter.

1. Access the TFS Menu by holding down any button while turning on the remote control. A password prompt will appear.
2. Enter the following password: Esc, Down, Up, Select, Select, Select, Select.
3. Use the Up or Down button to reach the desired PosOn, PosOff, NegOn, or NegOff item. Press Select.
4. Use the Up or Down button to change the timing parameter. Press Esc to exit from the change action.

3.6 FMS Alarm Values

About FMS Alarm Values

Normally, alarm levels are automatically adjusted when the output levels are set. The default alarm percentage value is 25%, which means the alarm levels are automatically adjusted to 25% of the output level. For proper maintenance and performance, alarm percentage should be set to 50-75%.

Positive and negative alarm levels can also be changed individually, without changing the output levels, as long as the alarm levels are adjusted after the output levels have been set. In addition, note that changing the positive or negative output level will cause the corresponding alarm level to reset.

Adjusting Alarm Values

It is important to set alarm values in coordination with environmental readings you get during a balance adjustment. See the Balance Adjustment section in this chapter.

1. Access the user-level menu by holding down any button while turning on the remote control. A password prompt will appear.
2. Enter in the following password: Esc, Down, Up, Select, Select, Select, Select.
3. Use the Up or Down button to reach the PosAlarm or NegAlarm item, Press Select.
4. Point the Remote Control model 5570 directly at the center AeroBar LED and use the Up or Down button to change the alarm level

Testing the Alarm

1. Hold down any button while turning on the remote. Once the remote comes on, enter the following password: Esc, Down, Up, Select, Select, Select, Select.
2. Use the Down button to reach the PosFdbk or NegFdbk menu item. Note the value(s) for use in Step 4 below.

3. Continue pressing the down button until you reach the PosAlrm or NegAlrm menu item. Press Select.
4. Use the Up button to change the alarm level so that it is above the corresponding Pos or Neg FeedBack level. (Change the alarm levels one at a time.)

3.7 Balance Adjustment and System Calibration

Simco-Ion balance adjustment and calibration procedure is a regular part of installation and maintenance of the AeroBar and its components. Adjustment for the AeroBar may be performed at initial installation, during periodic checks of the entire system, or anytime additional components are added to the system.

This section consists of the following information:

- About Adjustment and Calibration
- Tool parameters that Affect Ionization
- Performing the Adjustment
- Understanding Ionization Modes, Voltage Swing and Output, and Decay Timing
- Troubleshooting

Goals of Balance Adjustment and System Calibration

- Balanced, high ion density arriving to the surfaces and wafers
- Similar positive and negative decay times
- Maximum decay in the amount of available time
- Moderate voltage swings (Pulsed DC) or voltage offset (Steady-state DC) to eliminate the possibility of inducing voltage on the surfaces

Recommended Equipment

- Charge Plate Monitor Model 280A
- Tripod (optional)
- Anemometer

About Adjustment and Calibration

Environment variables and the physical properties of ions can lead to degraded ionization performance over time. This leads to a greater risk of static or the presence of voltage on your sensitive product surface.

In order to ensure optimal ionization performance and therefore static charge neutralization, ion delivery must be periodically regulated, or balanced. This procedure is commonly referred to as balance adjustment or system calibration.

Simco-Ion recommends performing a balance adjustment as part of a regular maintenance program. In general, AeroBars should be balanced every six months to a year. The actual frequency of balance adjustment depends on the specific activity of your application and environment.

In Pulsed DC mode, positive and negative ions are released sequentially during ontimes. During offtimes, no ions are released and existing ions disperse. In Steady-state DC mode, both positive and negative ions are constantly produced. The goal of the adjustment procedure is to regulate the ion delivery, so that equal numbers of positive and negative ions arrive at the work surface to neutralize static charges of either polarity in a specified amount of time.

Adjustment of the AeroBar Ionization System components may be performed during periodic checks of the entire system.

Tool Parameters that Affect Ionization

Balancing involves adjusting positive and negative ionization output levels and timing sequence of these outputs. You can make adjustments to the AeroBar Model 5225S settings using the Remote Control. In addition to the ionizer settings, be aware of the following variables that can affect balance:

- **Airflow:** The recommended airflow for effective ionization is 70-90 fpm. Low airflow moves the ions more slowly, allowing potential ion recombination and reducing the ions available to neutralize surfaces. High airflow moves the ions in a more direct path, reducing the surface coverage area.
- **Configuration:** Configuration changes differing from the original spec (such as adding a pre-aligner or metrology tool) may change the way the ions disperse. Also, metal objects closer than 6 inches to the AeroBar will ground ions, reducing the amount of ions available to the surfaces.

- **Maintenance:** Contaminants in the environment are attracted to AeroBar emitter points. Dirty emitter points have an adverse effect on ion output and voltage balance. As a general rule, emitter points should be cleaned every 3 months, and AeroBars should be rebalanced every 6 months to a year.
- **Environment:** Changes in cleanroom humidity and background airflow may affect performance.
- **Location:** AeroBar settings are based on the performance at a designed-in location. Repositioning or changing the mounting distance from the FFU will affect performance results.

Performing the Adjustment

1. Choose a specification for the measurements:

- If the facility has an existing specification for voltage swings and decay times, obtain these numbers and use them as a guideline. If specs are not available or do not exist, use the industry's typical setting. (± 50 to 100V for semiconductor tools and mini-environments and ± 100 to 150V for other fabrication in open areas.)
- A desired balance and decay time will depend on the sensitivity of the product to electrostatic-related problems. Choose values that meet the static charge protection needs of your environment; for example, the appropriate voltage swings range decreases for products more sensitive to electrostatic-related problems and increases for less sensitive products.
- If possible, set the AeroBar mode, outputs and timing to any pre-determined settings for your process tool. If no settings are available, use the following parameters for an optimization starting point: 50% Positive and Negative Power; 1.0 sec. On-times; 0.2 sec. off-times.

2. Set the CPM in an appropriate location for obtaining measurements:

Remove the charge plate from the monitor (refer to the charge plate monitor manual for instructions on removing the plate, Simco-Ion part number 19-0280A-M). For the AeroBar Model 5225, ideal locations include:

- Centralized in the mini environment chamber
- Next to a FOUP port
- On a pre-aligner
- On a metrology module
- On a buffer stations

After placing the CPM in its location, step away. Standing too close to the CPM may interfere with airflow and ion movement. Make sure all access doors are closed.

3. **Record the Airflow:** Use an anemometer to measure the airflow at the height of the CPM plate. Record the air flow along with the CPM measurements obtained at each sample location. Too high or low of an airflow rate will affect the true balance behavior of the ions. The recommended airflow for optimal ionization is 70-90 fpm.
4. **Take the measurements on the CPM:** The measurements taken on the CPM will record the following specifics:
 - Positive and negative peak voltages
 - Balance (an average of the positive and negative voltage peaks)
 - Positive and negative decay time
 - a) Allow the CPM to warm up for at least 15 minutes.
 - b) From the Main screen on the Model 280A CPM:
 - ⇒ Press **Auto**. The Auto test performs both Decay tests, followed by a balance test.
 - ⇒ Make sure the symbol "**D>**" is next to the test you want (usually the "Factory" test, which runs an auto test with standardized test parameters).
 - ⇒ Press **Start**
 - c) Note the numbers for +Vp (positive voltage peak), -Vp (negative voltage peak), and Vave (average or balance).
5. **Examine the Data and Adjust the AeroBars:** If the measurements have been taken for an operation area do not meet your specifications, use the Remote Control to adjust the AeroBar settings.

Understanding Ionization Modes, Voltage Swing and Output, and Decay Timing

Ionization Modes

Ensure that the AeroBar is operating within the appropriate ionization mode: Pulsed DC or steady-state DC:

- Pulsed DC mode is recommended for tool environments where the AeroBar to target exceeds 24 inches. Pulsed DC provides fast decay times and should not be used if large metal objects (such as a pre-aligner or measurement tool) are within 12 inches (30 cm) of the AeroBar.
- Steady-state DC mode is recommended for most semiconductor tool applications with tight performance specifications, or when the distance between the wafer and AeroBar is 8-12 inches (20-30 cm), or when large metal objects are within 12 inches (30 cm) of the AeroBar.

Voltage Swing and Output

Voltage swing refers to the range of the CPM plate voltage between the positive and negative peak readings at sample locations.

The recommended typical voltage output range is 50-80%.

- For Pulsed DC mode, adjust the positive and negative output voltages so that the maximum swing values are within 20V of each other--averaging a value as close to zero as possible. The swings should not exceed 150V in either direction. Keep the voltage swings below 100V if it is possible to meet the desired decay time at this output level.
- For steady-state DC mode, adjust the positive and negative output voltages so that the combined value of the positive and negative settings are as close to zero as possible and $<\pm 20V$.

Decay Timing

Decay timing is a measure of the time (in seconds) that it takes to decay a charge of +1000V to +100V, and -1000V to -100V. The conductive plate is charged to the initial test voltage of 1000V and is allowed to discharge to 10% of the initial test voltage. The time required for both polarities will be recorded.

In Pulsed DC mode, if decay times are too slow and voltage swings are greater than 100V, increase the positive and negative offtimes in 0.1 second increments. In steady-state mode, increase the positive and negative voltage outputs if the decay times are too long.

Troubleshooting the Balancing Procedure

1. **If decay times are too long:** Check that airflow is 70-90 fpm. If airflow is too low and cannot be changed, see the table, *Airflows Are Lower Than Tool Specification and Cannot Be Changed*:

| For Pulsed DC Mode | For Steady-state DC Mode |
|---|---|
| <p>If voltage swings are <100V, adjust + and - ontimes upward in 0.1 second increments until decay time stops improving or voltage swings become too high. Maintain last beneficial setting. Do not set below 0.7 seconds or alarms will be defeated. The normal range is 0.7 to 2 seconds.</p> <p>If voltage swings are >100V, adjust + and - offtimes upward in 1 second increments until decay time stops improving or voltage swings become too high. Maintain last beneficial setting.</p> | <p>Increase the positive and negative voltage outputs, maintaining a balance of $\pm 20V$.</p> |

2. If voltage swings are too high (pulsed DC only):

| If Voltage Outputs are >80% | If Voltage Outputs are <50% |
|---|--|
| <p>Decrease voltage outputs in 0.1% increments, maintaining balance, until swings are <100V or in desired range.</p> | <p>Decrease positive or negative on or offtimes in 0.1% increments, maintaining balance, until swings are <100V or in desired range</p> |

3. If airflows are lower than tool specification and cannot be changed:

| For Pulsed DC Mode | For Steady-state Mode |
|--|---|
| <ol style="list-style-type: none"><li data-bbox="114 207 497 354">1. Increase voltage outputs in 1% increments, maintaining balance until swings reach 100-150V. Do not exceed 90% output. If decay times are still too long, proceed to the next step.<li data-bbox="114 386 497 500">2. Increase + and - ontimes in 0.1 second increments, maintaining balance, until decay time improves or voltage swings become too high. Maintain last beneficial setting.<li data-bbox="114 532 497 646">3. Increase + and - offtimes in 0.1 second increments, maintaining balance, until performance stops improving. Maintain last beneficial setting. | <ol style="list-style-type: none"><li data-bbox="537 207 920 289">1. Increase voltage outputs in 0.1% increments, maintaining balance until output reaches 90%.<li data-bbox="537 329 944 378">2. If decay time is still too long, switch to Pulsed DC mode and balance. |

4

Maintenance

- 4.1 Maintenance Power Down
- 4.2 AeroBar Maintenance
- 4.3 Remote Control Maintenance
- 4.4 System Adjustment & Calibration

Caution: To avoid personal injury or damage to the equipment, do not perform any maintenance other than that contained in these instructions.

There are no user-serviceable parts inside the AeroBar.

4.1 Maintenance Power Down

Before performing any maintenance, the AeroBar must be powered down.

Warning: Never power-down by removing the power cable from the AeroBar, as this can result in damage to the ionizer.

To power-down the AeroBar, put the AeroBar in standby mode, turn off the power source, or disconnect the cable from the power source end.

Standby mode is a convenient way to turn off high voltage to the ionizer without removing wires. Standby mode is useful for maintenance periods where settings must be remembered.

1. Hold down any button while turning on the remote control. A password prompt will appear.
2. Enter in the following password: **Esc, Down, Up, Select, Select, Select, Select.**
3. Use the Up or Down button to reach the OpMode item. Press Select.
4. Point the remote control directly at the LEDs on the AeroBar and use the Up or Down button to select the operation mode (Standby, Pulsed, or StdySDC). Press Esc to exit.

4.2 AeroBar Maintenance

Primary maintenance for the AeroBar consists of periodic emitter point cleaning and replacement, system calibration, and exterior cleaning of the chassis. As maintenance schedules will vary depending on conditions, develop a schedule which meets the requirements for your application. In general, equipment should be checked on a monthly basis to ensure it is operating as originally set.

Emitter point cleaning is recommended every three to six months, and replacement every 24 to 36 months or when damage or erosion is evident. Calibration may be performed quarterly, semiannually, or annually depending on your application. Always clean the emitter points prior to calibration. Cleaning emitter points after calibration will alter the calibrated settings.

Where AeroBars are used in environments containing airborne molecular contaminants (AMC), emitter points should be cleaned every one to three months or wherever significant amounts of debris have accumulated on emitter tips.

Clean, new silicon tip

Eroded and dirty silicon tip

Figure 9. Clean and Dirty Silicon Tips

Emitter Point Inspection

Emitter point maintenance ensures continued optimum performance. Dirty or eroded points may cause system failure and diminished ionization output. Dirt or erosion on emitter points can be caused by a number of environmental factors, including the presence of airborne molecular contaminants ("AMCs"). It is important to create an inspection schedule for emitter points. Schedules will vary depending on your environment.

Inspect emitter points for white fuzz or buildup on the tips, or tips that are blackened or broken. Clean any buildup following the procedures described below.

Emitter Point Cleaning

Recommended Cleaning Materials:

- Cleanroom-compatible cloth swabs (polyester cloth is recommended) with a solution of 50% IPA (electronic-grade isopropyl alcohol)/50% de-ionized water.
- Simco-Ion Emitter Point Cleaner (Simco-Ion part number #22-1000).

Caution: Do not clean emitter points while the unit is powered. Doing so may result in additional contamination and possible shock. After powering down the AeroBar, allow a minute for the high voltage power supplies to discharge.

To clean the emitter points and areas around the emitter points, moisten a cleanroom-compatible swab with the IPA solution, or use Simco-Ion Emitter Point Cleaner. Gently rotate the swab around the emitter point until dirt or debris is removed.

Figure 10. Cleaning Points with the Emitter Point Cleaner

Do not alter emitter points in any way. Doing so may void the warranty.

Emitter Point Replacement

Emitter point replacement is recommended every 24 to 36 months, or when damage or erosion is evident.

To remove emitter points: Use a soft-jawed tool to remove silicon points. Silicon points are brittle and may break if handled roughly. When pulling a silicon point out, keep the point straight. Do not move the emitter point from side to side, or the point may snap.

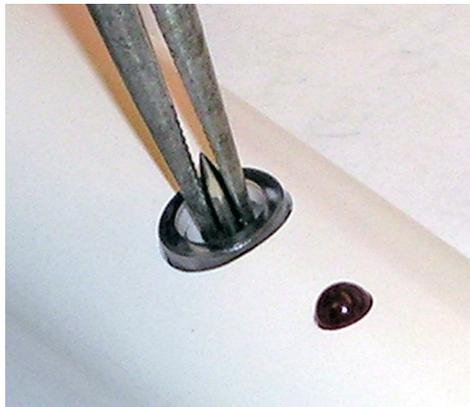

Figure 11. Removal of Silicon Emitter Point

Clean the area around the socket with a cleanroom-compatible cloth and IPA solution before inserting new points.

To insert new emitter points: Gently insert and press the new emitter point into the socket until it is fully seated. Do not push on the tip of the emitter point.

Chassis Cleaning

Use a cleanroom-compatible cloth moistened with 50% IPA and 50% de-ionized water to wipe down the chassis. Do not use any cleaners or solvents.

4.3 Remote Control Maintenance

Battery Life and Replacement

The Remote Control 5570 uses two AA alkaline batteries. Life is approximately 60 hours for full operation, and approximately 500 hours while in sleep mode.

Figure 12. Replacing Batteries in the Remote Control

If the battery voltage drops to ~2V, “**LowBatt**” will be indicated on the second line of the LCD display. Turn the remote control off with the slide switch to conserve battery life.

Sleep Mode

The Remote Control automatically goes into sleep mode if there is no button activity for 15 seconds. Press the Esc key to awaken the remote control. While in sleep mode, the LCD displays:

**Use ESC
To Awake**

If the battery is low during sleep mode, the bottom line is replaced with **LowBatt**.

4.4 System Adjustment & Calibration

Adjustment and calibration should be performed as a regular part of installation and maintenance activity.

Refer to Chapter 3 **Operation** for instructions on adjusting and calibrating the system.

5

Specifications

- 5.1 AeroBar Model 5225S
- 5.2 Parts & Accessories
- 5.3 Dimensional Drawings

5.1 AeroBar Model 5225S

| AeroBar Model 5225S | |
|------------------------|--|
| Input Voltage | 24 VAC, 50/60 Hz, 1W (typ) |
| Input Current | Approximately 40 mA per AeroBar, 1W (typ) |
| Output Voltage | 0-20 kVDC, $\pm 10\%$ for each polarity on an individual AeroBar; pos/neg output levels can be adjusted separately in 0.1% output power resolution |
| Output Current | <15 μ A, current and voltage limited |
| Control Signals | Open Collector, Active Low Alarm, 40 VDC max @ 200 mA max |
| Connectors | RJ-11 modular jack receptacle |
| Regulation | Output and balance stability is achieved by independently regulating the ion emission current of each polarity at each ionizer |
| Timing | Precise timing (0-10 sec @ 0.1 sec resolution); LEDs on each Bar indicate the polarity of ion emission |
| Operating Modes | Bipolar pulsed DC, steady-state DC, or standby |
| Alarm | Alarm activates when the bar is no longer able to maintain preset ion output levels. Alarm is displayed visually via red LED in middle of the chassis. Settable threshold alarm limits for predictive maintenance. |
| Emitter Points | Single-crystal silicon; replaceable |
| Maintenance | Annual, semi-annual, or quarterly, depending on process sensitivity and presence of AMCs in the environment |
| Ozone | <0.005 ppm (24-hour accumulation) |
| Operating Env. | Temperature 60-95°F (16-35°C); humidity 40-65% RH, non-condensing |
| EMI | Below background level |
| Cleanliness | Better than ISO Class 1 |
| LED Indicators | 2 red POS/NEG ION OUTPUT; 1 middle red ALARM/STANDBY; all 3 blink at once when communication occurs; 2 transmit/receive indicate communication with an optional IR remote control |
| Components | IR Handheld Remote Model 5570 (required) |
| Optional | Din rail mount transformer 230 VAC/24 VAC (p/n 14-21730) |
| Enclosure | Fire-retardant ABS plastic |

| | | |
|-----------------------------------|---|----------------|
| Dimensions | 22.4" bar: 2.1H x 1.2W x 22L in. (5.3H x 3.05W x 56.9L mm) | |
| | 28.4" bar: 2.1H x 1.2W x 28L in. (5.3H x 3.05W x 72.1L mm) | |
| Dimensions | 44.4" bar: 2.1H x 1.2W x 44L in. (53H x 30.5W x 112.8L mm) | |
| | 64.4" bar: 2.1H x 1.2W x 64L in. (53H x 30.5W x 163.6L mm) | |
| | 84.4" bar: 2.1H x 1.2W x 84L in. (53H x 30.5W x 214.4L mm) | |
| | 3 lengths for 300 mm EFEM applications available: | |
| | 35.7" bar: 2.1H x 1.2W x 35.7L in. (53H x 30.5W x 90.7L mm) | |
| Weight | 55.6" bar: 2.1H x 1.2W x 55.6L in. (53H x 30.5W x 141.2L mm) | |
| | 75.5" bar: 2.1H x 1.2W x 75.5L in. (53H x 30.5W x 191.8L mm) | |
| Weight | 1.5 lb, (1.0 kg), 22" bar; approx. 6 oz oer additional foot (0.17 kg per additional 30 cm) | |
| Warranty | 2 year limited warranty | |
| Certifications |   | SEMI F47 |
| | | RoHS Compliant |
| Handheld Remote Model 5570 | | |
| Dimensions | 4.75H x 2.75W x .88L inches (12.07 x 6.99 x 2.22 cm) | |
| Weight | 1 lb (0.46 kg) | |
| Material | ABS high-impact plastic, minimum particle traps | |
| Cleanroom Class | Class 1 or better | |
| Indicators | 2-line, 8-character display | |
| Controls | 4 keys: Up, Down, Esc, Select | |
| Input/output Signals | IRDA compatible 2-way InfraRed communication. | |
| Operating Distance | Infrared range operates at a min of 2 ft. and max of 10 ft.; 22-degree cone of operation from the transmitter | |
| Power | Two 1.5V batteries | |
| Life | Battery life approx. 60 hrs in full operation, 500 hrs in sleep mode | |
| Certifications |  | |

5.2 Parts & Accessories

AeroBars

| | |
|---------------|--|
| 91-5225SU-22R | 22" AeroBar with Ultraclean (Silicon) Emitter Points (5) |
| 91-5225SU-28R | 28" AeroBar with Ultraclean (Silicon) Emitter Points (7) |
| 91-5225SU-44R | 44" AeroBar with Ultraclean (Silicon) Emitter Points (9) |
| 91-5225SU-64R | 64" AeroBar with Ultraclean (Silicon) Emitter Points (13) |
| 91-5225SU-84R | 84" AeroBar with Ultraclean (Silicon) Emitter Points (17) |
| 91-5225SU-36R | 36" AeroBar with Ultraclean (Silicon) Emitter Points (8), 2-load port configuration |
| 91-5225SU-56R | 56" AeroBar with Ultraclean (Silicon) Emitter Points (12), 3-load port configuration |
| 91-5225SU-76R | 76" AeroBar with Ultraclean (Silicon) Emitter Points (16), 4-load port configuration |
| 91-5570 | Infrared Handheld Remote |

Accessories

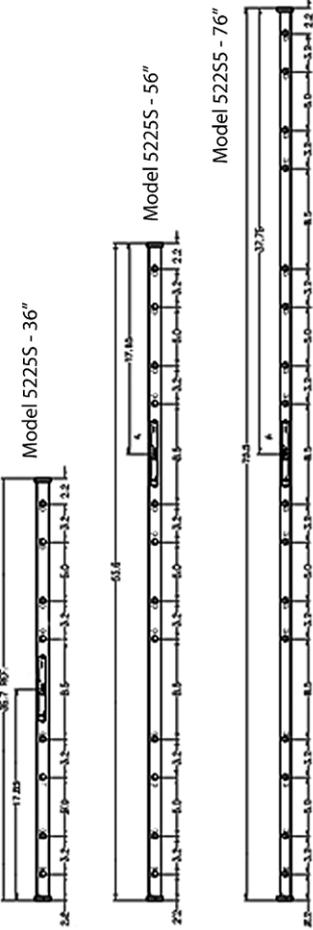

| | |
|------------|--|
| 33-1700-X | Interconnect cable, RJ-11 connectors, 26 AWG, 4-conductor, where X is the length: 0.5, 2, 6, 10, 15, 20, 30, 40 feet |
| 14-21730 | DIN rail mount transformer, 230 VAC to 24 VAC |
| 14-1535 | 100/115/230 VAC switchable desktop transformer |
| 14-1725-10 | Interconnect cable for use with 14-15353 transformer, RJ-11 to RJ-22 connectors, 10 ft long |
| 28-6225 | End-clip for Egg Crate (2 clips required per bar) |
| 28-6230 | Mid-clip for Egg Crate (Each) |
| 28-6235 | End-clip for hang mounting (2 clips required per bar) |
| 28-6240 | Mid-clip for hang mounting (required for 64" and 84" bars only) |
| 28-6255 | Flat clip for Horizontal Mounting (2 required for 44"; 3 required for 64" & 84") |
| 28-0505 | Pine Tree Clips (use two per end or grid clip) |
| 28-6257 | Grid Mounting Clips, requires two Pine Tree clips (28-0505) per Grid clip |
| 28-6245 | Wire Clips to secure cables to AeroBar |
| 93-1420 | Polycarbonate Rod and Flat Clip Assembly for lowering AeroBar clear 4" |

| | |
|---------|---|
| 93-1421 | Polycarbonate Rod and Flat Clip Assembly for lowering AeroBar clear 8" |
| 93-1422 | Polycarbonate Rod and Flat Clip Assembly for lowering AeroBar clear 12" |

Replacement Emitter Points and Cleaner

| | |
|------------|--|
| 22-0365-1 | Ultraclean Sleeved (Silicon) Emitter Points, box of 1 |
| 22-0365-10 | Ultraclean Sleeved (Silicon) Emitter Points, box of 10 |
| 22-0365-15 | Ultraclean Sleeved (Silicon) Emitter Points, box of 15 |
| 22-0365-20 | Ultraclean Sleeved (Silicon) Emitter Points, box of 20 |
| 22-0365-25 | Ultraclean Sleeved (Silicon) Emitter Points, box of 25 |
| 22-0365-30 | Ultraclean Sleeved (Silicon) Emitter Points, box of 30 |
| 22-1000 | Emitter Point Cleaner (Box of 50) |

300 mm EFEM Application Lengths

6

Warranty & Service

Simco-Ion provides a limited warranty for the AeroBar Model 5225S and Remote Control Model 5570. New products manufactured or sold by Simco-Ion are guaranteed to be free from defects in material or workmanship for a period of two (2) years from date of initial shipment. Simco-Ion liability under its new product warranty is limited to servicing (evaluating, repairing, or replacing) any unit returned to Simco-Ion that has not been subjected to misuse, neglect, lack of routine maintenance, repair, alteration, or accident. In no event is Simco-Ion be liable for collateral or consequential damages. Consumable items such as, but not exclusive to, emitter points, emitter wires, batteries, filters, fuses or light bulbs are only covered under this warranty if found defective as received with the new product.

To obtain service under this warranty, please contact Simco-Ion Technical Support at techsupport@simco-ion.com or (510) 217-0470.
